# Kidney and Upper Urinary Tract

J. Stuart Wolf, Jr., M.D.  
Professor of Urology

Fall 2008

**Michigan Urology Center**  
**University of Michigan**  
**Ann Arbor, MI**

# Kidney and Upper Urinary Tract

## Syllabus

- If I show you graphics that are NOT in your syllabus
  - Then they are NOT critical for the test
  - They are to familiarize you with Urologic operative techniques, for their interest rather than for testing purposes
- Radiography will be on test, but not the actual images

# Kidney and Upper Urinary Tract

## Objectives

- Appreciate importance, evaluation, and differential diagnosis of hematuria
- Gain basic understanding of major disease processes of kidney and upper tract
  - Obstruction
  - Calculi
  - Infection
  - Renal masses and cysts

# Kidney and Upper Urinary Tract

## **Clinically-Oriented Lecture**

**Hematuria**

**Evaluation and Differential**

**Case presentations of  
representative entities**

# Hematuria

- Definition
  - $\geq 3$  RBC / hpf in urinary sediment
  - Dipstick is screening test only
  - Dipstick is 95 % sensitive, but only about ~ 80% specific
  - In population with 10% hematuria, PPV of Dipstick is only 35%
  - Positive Dipstick indicates hematuria ONLY when confirmed by microscopy of  $\geq 3$  RBC / hpf

# Hematuria

- Additional Characterization
  - Gross (grossly visible) or microscopic?
    - Gross more likely significant
  - If gross, is it initial (urethra), terminal (bladder neck or prostate), or total (interior of bladder or upper tract)

### Evaluation 1: Examine Urine

- In women, get cath. UA if  $> 1$  squamous cell / hpf (vaginal contamination)
- Is color red but dipstick - ?
  - Consider phenolphthalein, rhodamine B, others
- Is dipstick + but no RBC present?
  - Beware if specific gravity  $< 1.008$  (RBC may have been there, but lysed)
  - Usually false positive test
  - Unfortunately, a common referral

### Evaluation 1: Examine Urine

- Is there pyuria or bacteruria?
  - Probable infection (any GU site)
- Is there proteinuria (> 2+ on dipstick), or are there dysmorphic RBCs or RBC casts?
  - Probable glomerulonephritis

### Evaluation 2: History and Physical

- Flank Pain
  - Stone
- Dysuria, bladder irritability
  - Bladder or prostate infection
- Sickle cell, diabetes
  - Papillary necrosis
- Family or personal history of calculi, PCKD, other GU / Neph diseases
  - Possible familial trait

### Evaluation 2: History and Physical

- Trauma, or intense physical activity
  - May be cause of hematuria
- Tobacco use, occupational chemical exposure (aromatic dyes)
  - Risk for renal and urothelial cancers

### Evaluation 2: History and Physical

- Visible blood at urethral meatus
  - Urethral source
- Fever, CVAT
  - Pyelonephritis
- Prostate exam
  - Prostatitis, Prostate cancer
- Pelvic Exam
  - Urethral, vaginal, or labial lesions

### Evaluation 3: Labs and Procedures

- Formal urinalysis with microscopic examination
- Urine culture
  - If infection is DOCUMENTED, then can omit rest of work-up if hematuria clears with antibiotics
- IVU versus KUB + US versus CT
- +/- Urine cytology
- +/- Serum electrolytes and creatinine
- Cystoscopy

## Diagnostic Categories

- Infection
- Calculi
- Cancer
- Benign neoplasms / lesions
- Other obstruction
- Trauma / exertional hematuria
- Medical renal disease
- Blood dyscrasia / anticoagulation
- Benign familial hematuria

## Infection

- **Kidney**
  - Pyelonephritis - parenchyma
  - Pyonephrosis - pus in collecting system
  - Renal abscess - pus pocket in parenchyma

## Infection

- Bladder
  - Bacterial cystitis
- Prostate
  - Bacterial prostatitis
- Urethra
  - Infectious urethritis

## Calculi

- Kidney
  - Obstructive vs. Non-obstructive
  - Simple vs. Staghorn
- Ureter
  - Obstructive vs. Non-obstructive
- Bladder

## Cancer

- Kidney
  - Renal cell carcinoma, other
- Upper collecting system
  - Urothelial, other
- Bladder
  - Urothelial, other
- Urethra
  - Squamous cell, other
- Prostate
  - Adenocarcinoma, other

## Benign Neoplasms / Lesions

- Kidney
  - Simple cysts
  - Cystic renal diseases
  - Angiomyolipoma, other neoplasms
- Ureter
  - Hemangioma, other
- Bladder
  - Endometrioma, other
- Urethra
  - Condyloma, other

## Other Obstructions

- Ureter
  - Ureteropelvic junction (UPJ)
  - Intrinsic strictures
  - Extrinsic obstruction
- Bladder
  - Bladder outlet obstruction (BOO)
    - Benign prostatic hyperplasia (BPH)
    - Other
- Urethra
  - Strictures, other

## Hematuria

### Trauma / Exertional Hematuria

- Cannot be assumed to be cause

### Medical Renal Disease

- Previous Nephrology lecture

### Blood Dyscrasia / Anticoagulation

- Cannot be assumed to be cause

### Benign Familial Hematuria

- Microscopic only, negative work-up

## Kidney & Upper Urinary Tract

# Kidney, Intra-renal Collecting System, and Ureter

- Topics covered (case presentations)
  - Ureteral obstruction (UPJO)
  - Calculi (ureteral, renal)
  - Infection (pyelonephritis)
  - Cancer (renal cell carcinoma)
  - Renal cystic disease (ADPKD)

## Kidney & Upper Urinary Tract: Obstruction

### Case 1: Ureteropelvic Junction Obstruction (UPJO)

- 24 year old woman
- Long history of intermittent left flank pain, recently worsening
- Not during sleep
- Especially notices after fluid intake, or even more after drinking alcohol
- No significant medical history

## Kidney & Upper Urinary Tract: Obstruction

### Case 1: Ureteropelvic Junction Obstruction (UPJO)

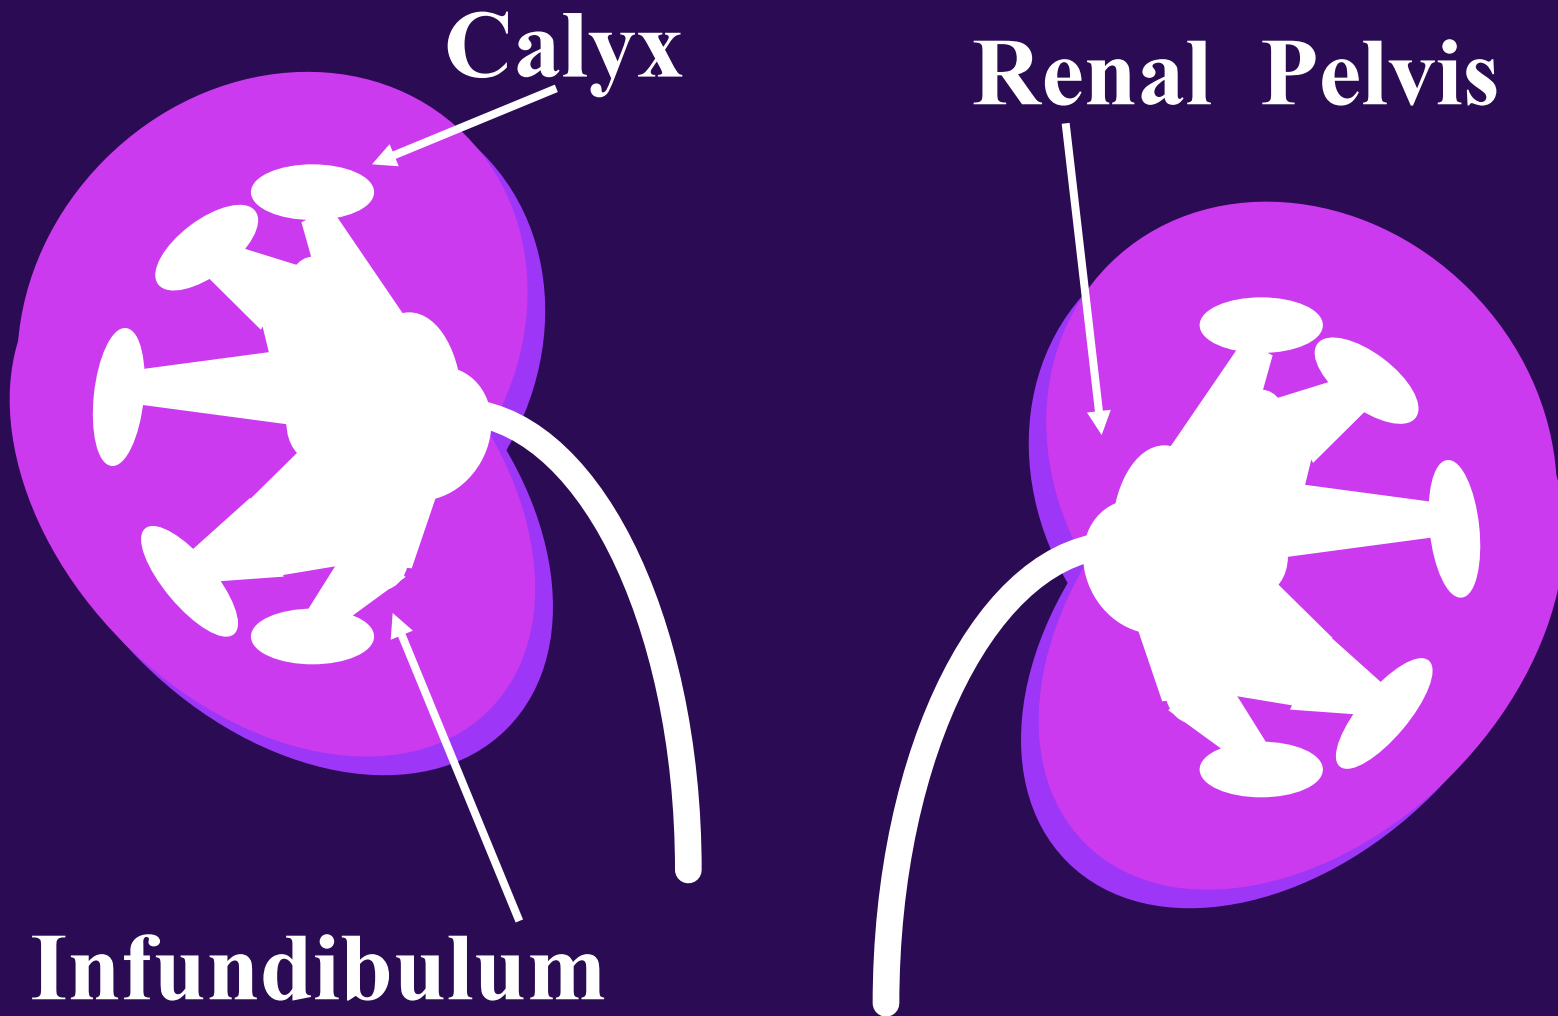

- Young age - diagnosed mostly in children, variable after that
- Intermittent symptoms - typical of adult presentation
- Pain increased with fluid intake
  - Classic for UPJO
  - Flow-dependent obstruction (like a slow but not-yet clogged drain)

## Kidney & Upper Urinary Tract: Obstruction

# Anatomy of Kidney and Upper Urinary Tract

- Paired Kidneys
- Urine from collecting tubules that terminate in papillae drain into:
  - Calyces, that coalesce into
  - Infundibula, which drain into
  - Renal Pelvis
- Travels down ureter (peristalsis)

# Kidney & Upper Urinary Tract: Obstruction

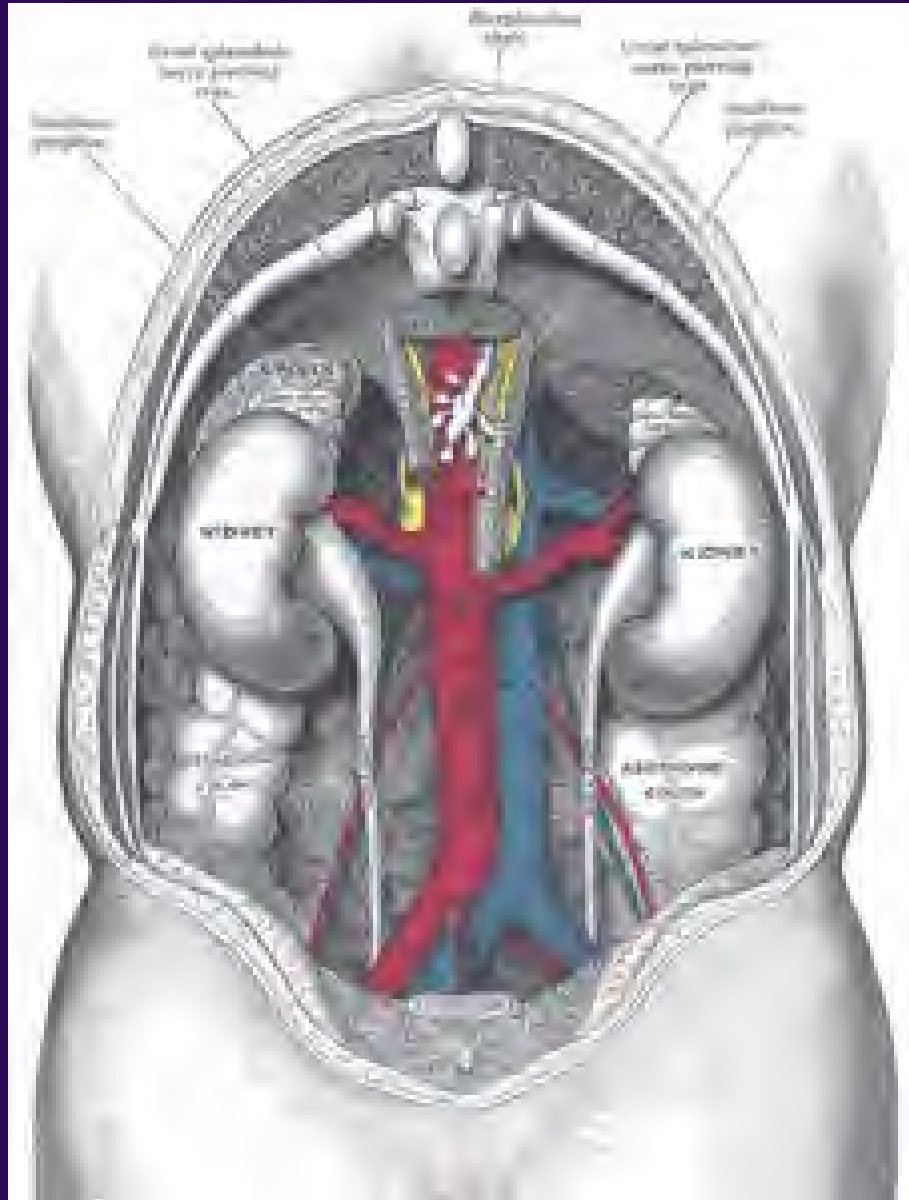

## Kidney & Upper Urinary Tract: Obstruction

### Anatomy of Kidney and Upper Urinary Tract

- “Tight spots” prone to obstruction
  - Ureteropelvic junction (UPJ)
  - Mid-ureter as crosses iliac vessels (over sacrum on plain radiograph)
  - Ureterovesical junction (UVJ)
- Of these, the UPJ most common site of congenital obstruction

**Image removed**

## Kidney & Upper Urinary Tract: Obstruction

### Case 1: Ureteropelvic Junction Obstruction (UPJO) Evaluation

- Intravenous urogram
  - Unilateral hydronephrosis and non-visualization of ureter
- Diuretic renal scintigraphy
  - 50% split renal function
  - T 1/2 (time for 1/2 of tracer to exit kidney) on symptomatic side > 100 minutes (normal < 10 minutes)

# Intravenous Urogram

**Left  
hydronephrosis  
and non-  
visualization of  
the ureter**

# Diuretic Renal Scintigraphy

**Excretion from left kidney is delayed**

## Kidney & Upper Urinary Tract: Obstruction

### Case 1: Ureteropelvic Junction Obstruction (UPJO) Treatment

- Percutaneous endopyelotomy
  - A minimally-invasive alternative to formal pyeloplasty
- Nephro-ureteral stent capped off in 1 week, and removed in 6 weeks
  - Complete resolution

## Kidney & Upper Urinary Tract: Obstruction

### Causes of UPJO

- Primary
  - Histological disorganization
    - excess longitudinal muscle fibers (loss of normal organization)
    - increase in collagen
    - attenuation of muscle bundles
  - Crossing vessels, high insertion, kinks, bands
- Secondary
  - Traumatic scar, iatrogenic scar, external compression (think cancer!)

# Kidney & Upper Urinary Tract: Obstruction

## Evaluation of UPJO

- Determine presence and degree of obstruction
  - Is there obstruction, or just dilation?
  - Complete or partial obstruction?
- Determine renal function
  - If kidney not working well, may be little value in repairing
- Determine cause of obstruction

## Kidney & Upper Urinary Tract: Obstruction

# Dilation of the Urinary Tract

- Non-obstructive
  - Ureteral reflux, prior obstruction, extra-renal pelvis, diuresis
  - Stagnation may lead to infection and calculi, but usually innocuous
- Obstructive
  - Increased resistance to urine flow that produces increased proximal pressure and subsequent loss of organ function
  - Occasionally difficult to distinguish from non-obstructive

# Massive Vesico-ureteral Reflux on Cystogram

# Kidney & Upper Urinary Tract: Obstruction

## Evaluation of UPJO

- Anatomic tests
  - Intravenous urography
  - Renal (surface) ultrasonography
  - Computed tomography
  - Endoluminal ultrasonography
- Functional tests
  - Ultrasonography with resistive indices
  - Diuretic renal scintigraphy
  - Whitaker test

# Intravenous Urography

Normal kidney

Hydronephrosis

# Renal Ultrasonography

Hydronephrosis

# Computed Tomography

Can determine additional anatomy, including vessels crossing at UPJ

# Computed Tomography

Can determine additional anatomy, including vessels crossing at UPJ

# Endoluminal Ultrasonography

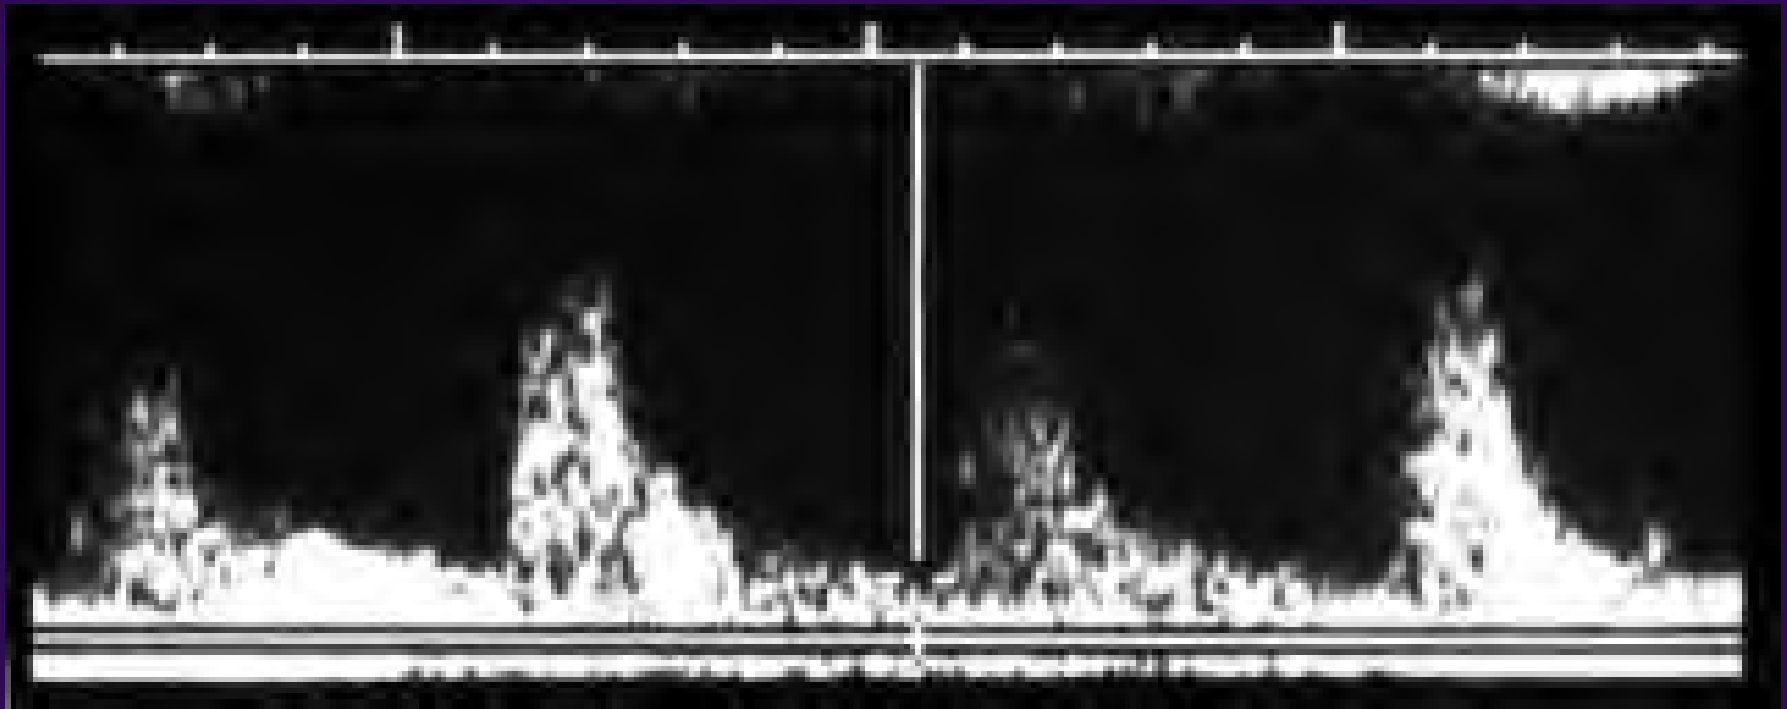

Can detect vessels crossing over UPJ, but requires retrograde catheterization

# Ultrasonography with Resistive Indices (PSV - LDV) / PSV: Normal

# Ultrasonography with Resistive Indices (PSV - LDV) / PSV: Obstructed

PD-INEL Source Undetermined

**As resistance to blood flow increases, diastolic flow velocity decreases, and resistive index increases ( $R.I. > 0.70$ )**

# Diuretic Renal Scintigraphy: most definitive non-invasive test

$T_{1/2}$  = Time for  $1/2$  of radiotracer to be excreted from kidney after furosemide

$T_{1/2} = 5$  minutes  
(normal  $< 10$  min.)

$T_{1/2} = 25$  minutes  
(obstructed  $> 15$  min.)

# Whitaker Test: most definitive test

Pressure in renal pelvis at set infusion rate through nephrostomy tube ( $> 15$  mmHg at 15 cc/min infusion = obstruction)

## Kidney & Upper Urinary Tract: Obstruction

### Treatment of UPJO

- Open pyeloplasty
  - Laparoscopic pyeloplasty
  - Percutaneous endopyelotomy
  - Retrograde balloon dilation
  - Retrograde endopyelotomy
  - Acucise® (cutting balloon) endopyelotomy
- Most Invasive / Most Effective**
- 
- Least Invasive / Least Effective**

Break

## Kidney & Upper Urinary Tract: Calculi

### Case 2: Acutely Obstructing Distal Ureteral Calculus

- 30 year old man
- Sudden onset of right flank pain
- Initial gross hematuria, but now clear
- No fevers and chills, but nausea
- Frequent urination
- Pain somewhat less after a few hours
- Restless, moving about
- Right flank, lower quadrant, and testicular pain / tenderness
- 5 - 10 RBC / hpf on urinalysis

## Kidney & Upper Urinary Tract: Calculi

### Case 2: Acutely Obstructing Distal Ureteral Calculus

- Sudden onset pain - c/w renal colic
- Urine cleared - suggests obstruction
- Nausea - very common with renal colic
- Freq. urination - irritation by distal calculi
- Pain decreased - forniceal rupture, decrease in pressure from renal hemodynamics
- Moving about - NOT peritonitis
- Flank to scrotum - expected radiation
- Urinalysis - RBCs in 85%

## Kidney & Upper Urinary Tract: Calculi

# Suspected Acute Ureteral Obstruction Differential Diagnosis

- Intrinsic
  - Calculi, tumor, clot, edema
- Extrinsic
  - Compression by tumor, lymph node
- Acute versus acute-on-chronic
  - Calculi, or calculi impacted into partially-obstructing stricture?
  - Clot, or clot on tumor?

## Kidney & Upper Urinary Tract: Calculi

# Suspected Acute Ureteral Obstruction Radiographic Evaluation

- KUB and Intravenous urography
  - Anatomic picture, localize pathology
- Ultrasonography
- CT
  - Non-contrast (stones)
  - CT urogram (with contrast, like IVU)
- Retrograde pyelography
  - Injection through catheter

# Intravenous Urography

This stone is less dense than contrast material, so appears as filling defect

# Intravenous Urography

# Intravenous Urography

# Kidney & Upper Urinary Tract: Calculi

## Spontaneous Passage of Ureteral Stones

<u>Width</u>	<u>Proximal</u>	<u>Middle</u>	<u>Distal</u>
4 mm	20%	45%	55%
5 mm	6%	30%	45%
6 mm	0%	10%	25%

# Ultrasonography

**Hydronephrosis**

# Computed Tomography

(almost) all  
stones dense  
on CT

# Computed Tomography

PD-INEL Source Undetermined

**Secondary signs of ureteral obstruction**

# Computed Tomography

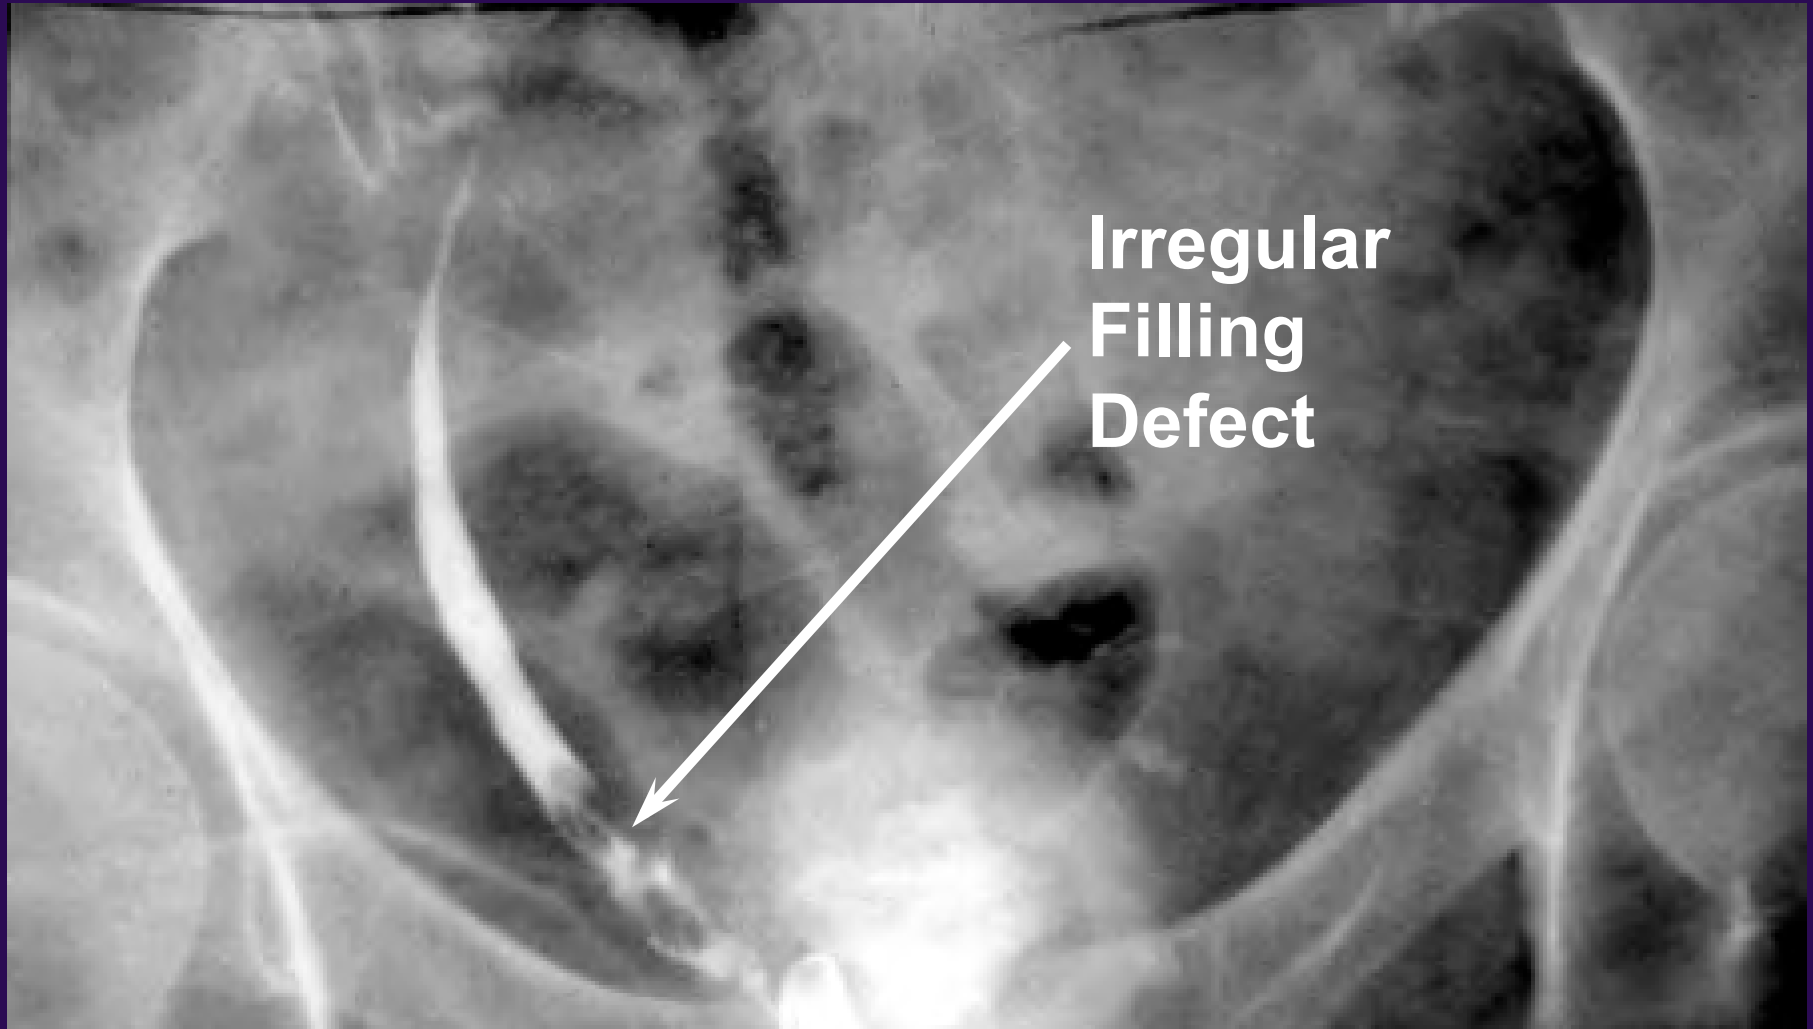

**Secondary signs of ureteral obstruction**

# Computed Urography

# Intravenous Urography

## Kidney & Upper Urinary Tract: Calculi

If “filling defect” on contrast study ...

- Neoplasm
  - Urothelial neoplasm most common
- Blood clot
  - Will resolve during follow-up
- “Radio-lucent” calculus (15%)
  - Other 85% are calcium containing
  - Refers to appearance on plain film (all typical stones are opaque on CT scan)
  - Radio-lucent stones are usually uric acid (only medically dissolvable stone)
- Need to rule-out tumor!

## Kidney & Upper Urinary Tract: Calculi

### Case 3: Non-obstructing Renal Calculus

- 65 year old man
- Microscopic hematuria
- Remote history of urolithiasis
- Mild prostatism
- Unremarkable PE except for prostatic enlargement
- Urinalysis - 10 RBC / hpf

# Plain Radiography

Densely  
radio-  
opaque  
stones

## Kidney & Upper Urinary Tract: Calculi

### Indications for Surgical Treatment of Urolithiasis

- Urinary tract infection
- Significant obstruction
- Pain refractory to oral medication
- Others
  - Staghorn calculi - risk of urosepsis
  - Long-standing ureteral calculi - eventual obstruction
  - Occupational or lifestyle reasons

# Plain Radiography

## Staghorn Calculus

## Kidney & Upper Urinary Tract: Calculi

### Surgical Treatment of Urolithiasis

- Open surgical / laparoscopic lithotomy
- Percutaneous nephrostolithotomy (Antegrade endoscopy)
- Ureteroscopy (Retrograde endoscopy)
- Extracorporeal shock wave lithotripsy (SWL)

**Most  
Invasive / Most  
Effective**

**Least  
Invasive / Least  
Effective**

# Aperture Angle – Focal Size (20 kV; -6dB line)

**Image removed**

PD-INEL

Source Undetermined

 PD-INEL Source Undetermined

## Kidney & Upper Urinary Tract: Calculi

# Parameters Determining Treatment of Urolithiasis

- Size
- Location
- Composition
- Medical Condition, Patient Preference, Physician Preference

# Kidney & Upper Urinary Tract: Calculi

## Size

- Small
  - SWL
- Moderate
  - Ureteroscopy
- Large
  - Percutaneous nephrostolithotomy

# Kidney & Upper Urinary Tract: Calculi

## Location

- Distal Ureter
  - Scope > SWL
- Middle Ureter
  - Scope > SWL
- Proximal Ureter
  - SWL > Scope ?
- Kidney
  - SWL > Scope

# Computed Tomography

**Distal aspect of UVJ, almost in bladder**

# Computed Tomography

PD-INEL Source Undetermined

**Huge bilateral renal calculi**

# Kidney & Upper Urinary Tract: Calculi

## Composition

- Dense (Calcium oxalate monohydrate)
  - Scope
- Fuzzy/ Faint (Calcium oxalate dihydrate, calcium phosphate, struvite)
  - SWL
- Cystine
  - Scope
- Uric Acid
  - SWL

# Plain Radiography

Densely  
radio-  
opaque

# Plain Radiography

“Fuzzy”  
radio-  
opaque  
stone

## Kidney & Upper Urinary Tract: Pyelonephritis

### Case 4: Pyelonephritis

- 29 year old woman
- Started with 3 days of dysuria (painful urination), urinary frequency / urgency
- Now temp 101.7° C, right flank pain
- History
  - Occ previous UTI
  - Recently married
  - Limited sexual activity before marriage, now active
- PE - Right CVAT

## Kidney & Upper Urinary Tract: Pyelonephritis

### Case 4: Pyelonephritis

- Young woman - UTI is common
- Initial cystitis (infection ascends) common and suggest UTI
- Systemic symptoms - distinguishes upper from lower tract UTI
- Previous UTI - helps establish her characteristic symptoms of UTI
- Sexual activity - predisposing factor for UTI in women
- CVAT - renal involvement

## Kidney & Upper Urinary Tract: Pyelonephritis

### Acute Pyelonephritis

- Most common disease of the kidney
- Usually ascending infection
- Diagnosis by clinical findings and urine culture (85% are GNR; E. Coli)
- Imaging used to detect complications or to assess for predisposing factors
- Complications: papillary necrosis, pyonephrosis, abscess, sepsis
- Predisposing factors: obstruction, calculi, vesico-ureteral reflux

PD-INEL Source Undetermined

## Lobar Nephronia

## Kidney & Upper Urinary Tract: Pyelonephritis

### Management of Acute Pyelonephritis

- Typical case - fever resolves within 48 hrs of starting antibiotics
  - Oral abx in most
  - Intravenous abx if very ill-appearing
- Debilitated patients at greater risk
  - Diabetes mellitus
  - Steroids
  - Chronically ill
  - Immuno-suppressed

## Kidney & Upper Urinary Tract: Pyelonephritis

### Management of Acute Pyelonephritis

- History of complications or lack of response to antibiotics
  - US or CT for obstruction, calculi
- Upper tract obstruction with infection
  - DRAINAGE (stent, percutaneous tube)
- Upper tract calculus with infection
  - Treat acute infection, then calculus
- If child or recurrent
  - US for scars
  - Voiding cystogram for reflux

# Kidney & Upper Urinary Tract: Pyelonephritis

## Drainage procedures

- Percutaneous nephrostomy tube

Image of a  
percutaneous  
nephrostomy  
tube removed

- Ureteral stent

Break

## Kidney & Upper Urinary Tract: Masses & Cysts

### Case 5: Renal Cell Carcinoma (RCC)

- 64 year old man
- Gross hematuria
- Flank pain
- History
  - 66 pack-year smoker
- PE
  - Fullness in right flank

## Kidney & Upper Urinary Tract: Masses & Cysts

### Case 5: Renal Cell Carcinoma (RCC)

- Older man - peak in 6<sup>th</sup> decade, 3:1 M:F overall
- Hematuria - most common presenting sign
- Flank pain and flank mass - along with hematuria, the classic triad
- Smoking - major acquired risk factor

# Kidney & Upper Urinary Tract: Masses & Cysts

## Demographics of RCC

- Incidence: 12.8 per 100,000 ('00 - '04)
- Mortality: 4.2 per 100,000 ('00 - '04)
- estimated 51,190 new cases in 2007 (~2% of adult malignancies)
- estimated 12,890 deaths in 2007
- Lifetime Risk (M / F)
  - Risk of occurrence - 1.71 / 1.01 %
  - Risk of death - 0.59 / 0.35 %

**SEER Cancer Statistics**

# Kidney & Upper Urinary Tract: Masses & Cysts

## Risk factors for RCC

- Cigarettes
- Obesity
- Hypertension
- Occupational exposures
- Dialysis
- Hereditary
  - von Hippel-Lindau disease
  - Tuberous Sclerosis

# Kidney & Upper Urinary Tract: Masses & Cysts

## Pathology of RCC

- Proximal tubular cell neoplasm
- Often venous involvement
- Hemorrhagic, necrotic, cystic, and calcified components common
- Metastasize most commonly to lung, liver, bone, adrenal, and contralateral kidney

# Kidney & Upper Urinary Tract: Masses & Cysts

## Common Renal Tumors

<u>Pathology</u>	<u>Malignant?</u>	<u>Relative %</u>
Renal Cell Ca.	Yes	85%
Urothelial Ca.	Yes	5%
Oncocytoma	No	5%
Other	Most not	5%

# Kidney & Upper Urinary Tract: Masses & Cysts

## Histology

- Most Renal Cell Carcinomas have “Clear cell” histology
  - Lipids (dissolve out during slide processing) and glycogen
  - Fuhrman grading (1 to 4)
    - 1 = well differentiated
    - 4 = poorly differentiated

# Kidney & Upper Urinary Tract: Masses & Cysts

## Genetics

- Most renal cell carcinomas are sporadic
- Are associated with several syndromes, the most common of which is Von-Hippel Lindau syndrome
  - Autosomal dominant
  - Cerebellar and retinal vascular tumors
  - Adrenal and renal tumors (inc cysts)

# Kidney & Upper Urinary Tract: Masses & Cysts

## Genetics

- Von-Hippel Lindau syndrome
  - Autosomal dominant
  - Mutation in VHL tumor suppressor gene: 3p25-26
- 95% of sporadic “clear cell” renal cell carcinomas have VHL mutation
  - One of the strongest associations among solid tumors
  - Opportunities for gene therapy

# Kidney & Upper Urinary Tract: Masses & Cysts

## Symptoms / Signs of RCC

- Hematuria (29 – 60%)
- Flank pain (14 – 51%)
- Flank mass (21 – 47%)
- All 3 = Classic triad
  - Present in < 10%
  - Usually signifies advanced disease

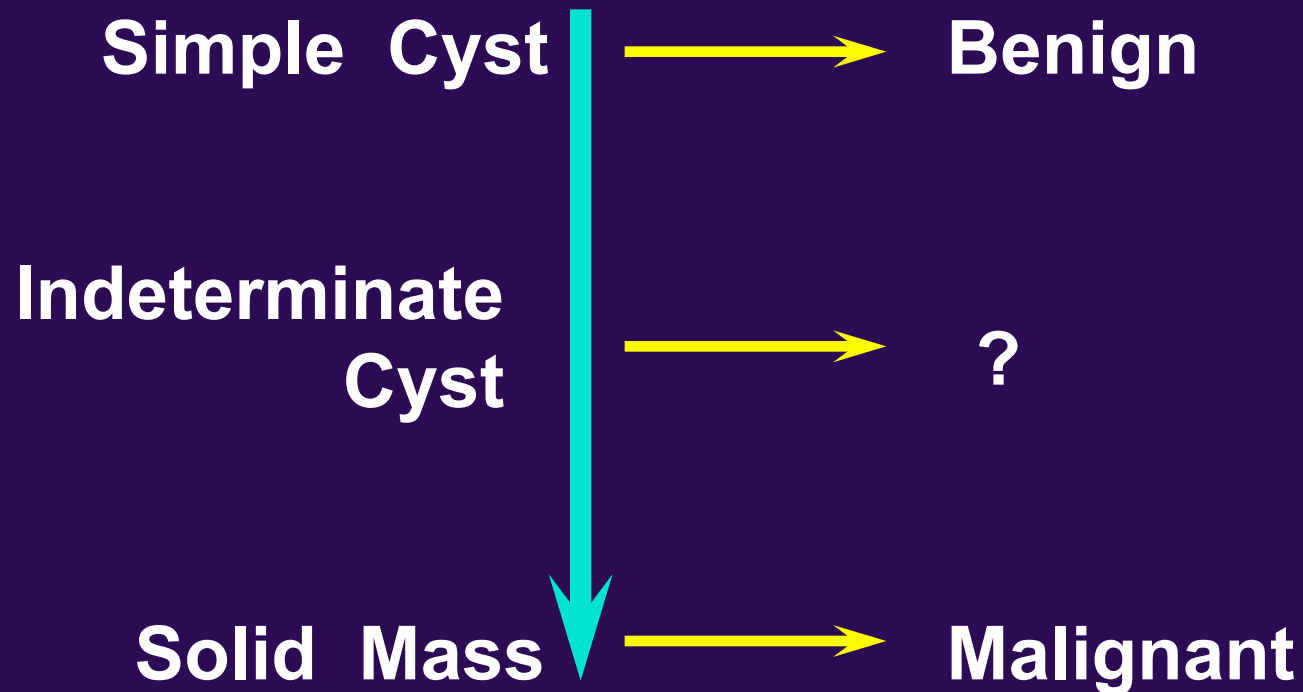

# Kidney & Upper Urinary Tract: Masses & Cysts

## Paraneoplastic Syndromes

- ESR elevation
- Calcium elevation
- Polycythemia
- Anemia
- Thrombophlebitis
- Hyperinsulinism
- LFT elevation

# Kidney & Upper Urinary Tract: Masses & Cysts

## Central Role of Imaging

## Kidney & Upper Urinary Tract: Masses & Cysts

### Stage Migration of RCC due to more frequent imaging

- 1970' s
  - 4% of RCC  $\leq$  3 cm
  - 32% presented with metastases
- 1980' s
  - 25 - 40% were incidental finding
  - 25% of RCC  $\leq$  3 cm
  - 17% presented with metastases
- 1990' s
  - 60% were incidental finding

# Kidney & Upper Urinary Tract: Masses & Cysts

## Imaging Modalities

- Intravenous Urography (IVU, IVP)
- Ultrasonography (US)
- Computed Tomography (CT)
- Magnetic Resonance Imaging (MRI)

## Kidney & Upper Urinary Tract: Masses & Cysts

### Intravenous Urography

- Typical upper tract imaging for hematuria work-up
- Excellent visualization of collecting system
- Renal mass or cyst causes displacement of surrounding organ or deformation of outline
- Screening study only
- If renal mass / cyst suspected, further imaging is required

# Intravenous Urography

Mass Effect  
in kidney

# Kidney & Upper Urinary Tract: Masses & Cysts

## Ultrasonography

- Usual follow-up to IVU suspicious for renal mass / cyst
- No ionizing radiation
- Non-invasive
- Operator dependent
- Reliably identifies simple cyst (85% of renal mass / cysts)
- If NOT a simple cyst
  - ➔ Cross-sectional imaging

# Ultrasonography

**Simple Cyst**

# Kidney & Upper Urinary Tract: Masses & Cysts

## Sonographic Characteristics

- Anechoic with enhanced through transmission
  - ➔ Simple cyst
- Echogenic with acoustic shadowing
  - ➔ Stone or other calcification
- Iso / hypoechoic mass
  - ➔ Solid mass

# Ultrasonography

**Renal Stone**

# Ultrasonography

**Nodule in Cyst**

# Ultrasonography

**Solid Mass**

# Kidney & Upper Urinary Tract: Masses & Cysts

## Computed Tomography

- Current gold standard
- Non-contrast scan, then scan with intravenous contrast
  - Enhancement = Hounsfield units (density) increase by  $\geq 10$  with contrast
- 3 to 5 mm maximum cut width
- Spiral CT - single breath hold
  - Minimize motion artifact
  - Exact duplication of cuts

# Computed Tomography

Simple Cyst

# Computed Tomography

PD-INEL Source Undetermined

**Complex Cyst**

**Renal Cell Carcinoma**

## Kidney & Upper Urinary Tract: Masses & Cysts

Solid, Enhancing Renal Mass on CT is  
RCC until Proven Otherwise

- Other possibilities
  - Oncocytoma
    - Benign, but indistinguishable from RCC on imaging
  - Angiomyolipoma
    - Benign, but can bleed if large
    - Usually diagnosed by imaging fat
  - Inflammatory mass
    - History of febrile illness
  - Lymphoma
    - Malignant, but no surgery

© PD-INEL Source Undetermined

**Oncocytoma ?**

Angiomyolipoma

# Renal Abscess

# Renal Lymphoma

# Kidney & Upper Urinary Tract: Masses & Cysts

## Magnetic Resonance Imaging

- Currently no advantage over CT except in certain situations
  - Allergy to contrast material
  - Elevated creatinine
  - Distinguish wall in some cysts
  - Detection of venous tumor thrombus in RCC (has replaced invasive venography)

# Magnetic Resonance Imaging

PD-INEL Source Undetermined

**Thick Cyst Wall**

# Magnetic Resonance Imaging

Tumor  
Thrombus  
in Vena  
Cava

## Kidney & Upper Urinary Tract: Masses & Cysts

### Sensitivity for Diagnosis of RCC $\leq$ 3 cm

- Intravenous urography - 67%
- Ultrasonography - 79%
- Computed tomography - 94%

# Kidney & Upper Urinary Tract: Masses & Cysts

## Evaluation of Suspected RCC

- Initial imaging study (often IVU or US, either incidentally or for workup of hematuria or other signs / symptoms)
- CT or MRI for local assessment
  - Define lesion
  - Assess nodes, vein, other organs
- Staging
  - CXR, Bloods, + Bone Scan and others

## Kidney & Upper Urinary Tract: Masses & Cysts

### Staging and Management of RCC

- Stage I
  - Tumor < 7 cm limited to kidney (T1)
  - no LN+ or metastases
  - Radical or Partial Nephrectomy
- Stage II
  - Tumor > 7 cm limited to kidney (T2)
  - No LN+ or metastases
  - Radical Nephrectomy

## Kidney & Upper Urinary Tract: Masses & Cysts

### Staging and Management of RCC

- Stage III
  - Tumor into vein, fat, or adrenal
  - Or one single LN+
  - Radical Nephrectomy
- Stage IV
  - Tumor beyond Gerota's fascia (T4)
  - Or > 1 LN+ Or metastases
  - Systemic Therapy (Chemo, Immuno)

# Kidney & Upper Urinary Tract: Masses & Cysts

## Prognosis of RCC

	5 year survival
● Stage I	~90%
● Stage II	~80%
● Stage III	~40 - 60%
● Stage IV	~10%

## Kidney & Upper Urinary Tract: Masses & Cysts

### Case 6: Autosomal Dominant Polycystic Kidney Disease (ADPKD)

- 37 year old woman
- No recent medical care
- Left flank “fullness”
- Adopted, unknown family history
- PE
  - Mass in left flank
  - BP 170/100

## Kidney & Upper Urinary Tract: Masses & Cysts

### Case 6: Autosomal Dominant Polycystic Kidney Disease (ADPKD)

- Middle-aged - usually diagnosed in third decade
- “Fullness” - HUGE bilateral cysts, symptomatic in ~15%
- Over 50% have family history
- Hypertension - almost always, given enough time

# Kidney & Upper Urinary Tract: Masses & Cysts

## ADPKD

- Autosomal dominant inheritance
  - 85% from *PKD1* mutation (16q13)
  - 15% from *PKD2* mutation (4q21-23)
- Virtually 100% penetrance
- Incidence
  - 1 / 1000 live births
  - 6000 new cases annually
- Prevalence ~ 200,000

# Kidney & Upper Urinary Tract: Masses & Cysts

## ADPKD

- Epithelial proliferation in renal tube → renal tubule become cyst → as cyst grows it compresses renal parenchyma
- < 1% tubules become cysts
- Also hepatic, pancreatic and splenic cysts, and cerebral aneurysms
- Hypertension
- Renal failure - most but not all, usually in 5<sup>th</sup> decade

# ADPKD

## Kidney & Upper Urinary Tract: Masses & Cysts

### Other Cystic Diseases of the Kidney

- Simple cysts
  - In population over age 50
    - 50% pathologically, 33% by CT
  - Single or multiple
- Simple cyst complicated by hemorrhage or infection (“Complex cyst”)
- Acquired cystic kidney disease (ACKD)
  - 40% of dialysis patients by 3 years
  - Controversial increase in RCC

# ACKD

# Kidney & Upper Urinary Tract: Masses & Cysts

## Evaluation of Renal Cysts

- Simple cysts definable with US
  - No further work-up needed
- ADPKD, ACKD
  - Definable by history and PE
- “Complex Cyst”
  - Simple cyst complicated by infection or hemorrhage
  - Cystic renal cancer
  - Diagnostic dilemma, surgery often required
