Tuples are like lists

- Tuples are another kind of sequence that function much like a list - they have elements which are indexed starting at 0

```python
>>> x = ('Glenn', 'Sally', 'Joseph')
>>> print(x[2])
Joseph
>>> y = (1, 9, 2)
>>> print(y)
(1, 9, 2)
>>> print(max(y))
9
>>> for iter in y:
...    print(iter)
...    ...
1
9
2
```
..but.. Tuples are "immutable"

- Unlike a list, once you create a tuple, you cannot alter its contents - similar to a string

```python
>>> x = [9, 8, 7]
>>> x[2] = 6
>>> print x[9, 8, 6]
Traceback: 'str' object does not support item assignment
>>> y = 'ABC'
>>> y[2] = 'D'
Traceback: 'str' object does not support item assignment
>>> z = (5, 4, 3)
>>> z[2] = 0
Traceback: 'tuple' object does not support item assignment
>>> 
```
Things not to do with tuples

```python
>>> x = (3, 2, 1)
>>> x.sort()
Traceback: AttributeError: 'tuple' object has no attribute 'sort'
>>> x.append(5)
Traceback: AttributeError: 'tuple' object has no attribute 'append'
>>> x.reverse()
Traceback: AttributeError: 'tuple' object has no attribute 'reverse'
```
A Tale of Two Sequences

```python
>>> l = list()
>>> dir(l)[
'avoid', 'count', 'extend', 'index', 'insert',
'pop', 'remove', 'reverse', 'sort']

>>> t = tuple()
>>> dir(t)
['count', 'index']
```
Tuples are more efficient

- Since Python does not have to build tuple structures to be modifiable, they are simpler and more efficient in terms of memory use and performance than lists.
- So in our program when we are making "temporary variables" we prefer tuples over lists.
Tuples and Assignment

- We can also put a **tuple** on the **left hand side** of an assignment statement
- We can even omit the parenthesis

```python
>>> (x, y) = (4, 'fred')
>>> print y
Fred
>>> (a, b) = (99, 98)
>>> print a
99
```
Tuples and Dictionaries

- The `items()` method in dictionaries returns a list of (key, value) tuples.

```python
>>> d = dict()
>>> d['csev'] = 2
>>> d['cwen'] = 4
>>> for (k,v) in d.items():
...     print k, v
...
  csev 2
  cwen 4
>>> tups = d.items()
>>> print tups
[('csev', 2), ('cwen', 4)]
```
Tuples are Comparable

- The comparison operators work with tuples and other sequences. If the first item is equal, Python goes on to the next element, and so on, until it finds elements that differ.

```python
>>> (0, 1, 2) < (5, 1, 2)
True
>>> (0, 1, 2000000) < (0, 3, 4)
True
>>> ('Jones', 'Sally') < ('Jones', 'Sam')
True
>>> ('Jones', 'Sally') > ('Adams', 'Sam')
True
```
We can take advantage of the ability to sort a list of tuples to get a sorted version of a dictionary.

First we sort the dictionary by the key using the `items()` method:

```python
>>> d = {'a':10, 'b':1, 'c':22}
>>> t = d.items()
>>> t
[('a', 10), ('c', 22), ('b', 1)]
>>> t.sort()
>>> t
[('a', 10), ('b', 1), ('c', 22)]
```
Using `sorted()`

We can do this even more directly using the built-in function `sorted` that takes a sequence as a parameter and returns a sorted sequence.

```python
>>> d = {'a':10, 'b':1, 'c':22}
>>> d.items()
[('a', 10), ('c', 22), ('b', 1)]
>>> t = sorted(d.items())
>>> t
[('a', 10), ('b', 1), ('c', 22)]

>>> for k, v in sorted(d.items()):
...    print k, v
...
...    a 10
...    b 1
...    c 22
```
Sort by values instead of key

- If we could construct a list of tuples of the form (value, key) we could sort by value.
- We do this with a for loop that creates a list of tuples.

```python
c = {'a':10, 'b':1, 'c':22}
tmp = list()
for k, v in c.items():
    tmp.append((v, k))
...
print(tmp)
[(10, 'a'), (22, 'c'), (1, 'b')]
tmp.sort(reverse=True)
print(tmp)
[(22, 'c'), (10, 'a'), (1, 'b')]
```
```python
fhand = open('romeo.txt')
counts = dict()
for line in fhand:
    words = line.split()
    for word in words:
        counts[word] = counts.get(word, 0) + 1

lst = list()
for key, val in counts.items():
    lst.append( (val, key) )
lst.sort(reverse=True)
for val, key in lst[:10] :
    print key, val
```

The top 10 most common words.
List comprehension creates a dynamic list. In this case, we make a list of reversed tuples and then sort it.

http://wiki.python.org/moin/HowTo/Sorting
Summary

• Tuple syntax
• Mutability (not)
• Comparability
• Sortable
• Tuples in assignment statements
• Using sorted()

• Sorting dictionaries by either key or value
